Module 9 Using Functions
Lesson 3 Writing Functions from Patterns

## DATE

For each table, write a function to represent the pattern shown.

## Journal

1. A student looked at a table of values and noticed that the ordered pair $(1,1)$ was an ordered pair in the function. She believes that the function being described in the table is $f(x)=x$. Is she correct? Explain.
2. Explain how to use slope to determine whether a function is a linear function.
3. In a linear function, why is it especially helpful to have 0 as one of the $x$-values in the table? How does it make writing the linear function easier?
4. Explain how a scatterplot can help determine the function represented in a table of values.
5. The directions for the exercises in this lesson read, "Write a function for the input/output table." Could the directions be written as, "Write the function for the input/output table?" Why or why not?

## Cumulative Review

Identify the slope and $y$-intercept of each line.
